DESCRIPTION:

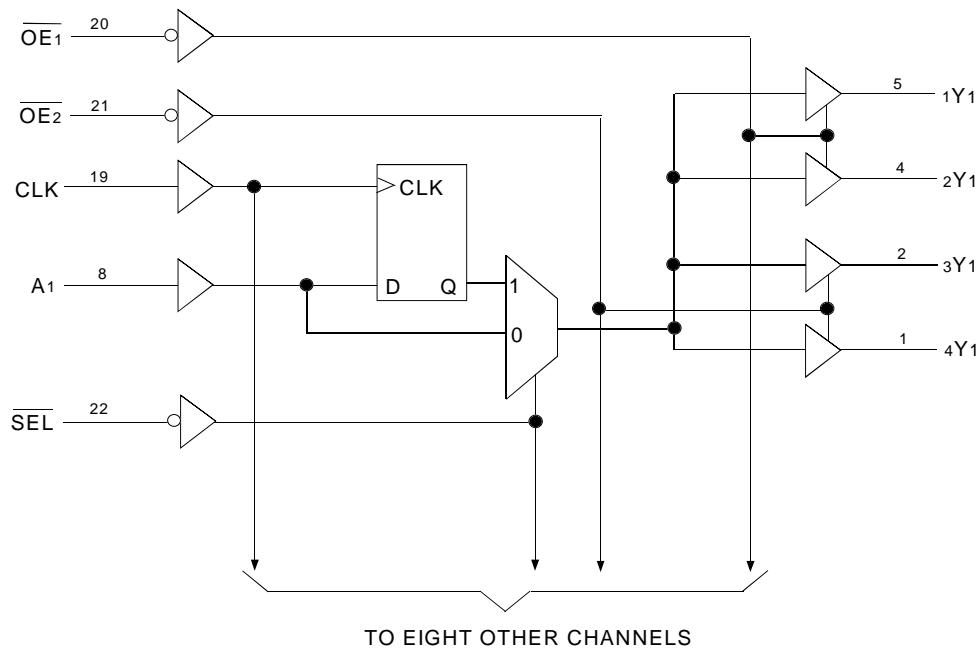

This 1-bit to 4-bit address register/driver is built using advanced dual metal CMOS technology. This device is ideal for use in applications in which a single address bus is driving four separate memory locations. The ALVCH16831 can be used as a buffer or a register, depending on the logic level of the select (\overline{SEL}) input.

When \overline{SEL} is logic high, the device is in the buffer mode. The outputs follow the inputs and are controlled by the two output-enable (\overline{OE}) controls. Each \overline{OE} controls two groups of nine outputs. When SEL is logic low, the device is in the register mode. The register is an edge-triggered D-type flip-flop. On the positive transition of the clock (CLK) input, data set up at the A inputs is stored in the internal registers. \overline{OE} controls operate the same as in buffer mode.

The ALVCH16831 has been designed with a $\pm 24\text{mA}$ output driver. This driver is capable of driving a moderate to heavy load while maintaining speed performance.

The ALVCH16831 has "bus-hold" which retains the inputs' last state whenever the input bus goes to a high-impedance. This prevents floating inputs and eliminates the need for pull-up/down resistors.
