

# RETRIGGERABLE MONOSTABLE **MULTIVIBRATOR WITH CLEAR**

# N74122-A,F • S54123-B,F,W • N74123-B,F

# DIGITAL 54/74 TTL SERIES

PIN CONFIGURATIONS

## DESCRIPTION

These monostables are designed to provide the system designer with complete flexibility in controlling the pulse width, either to lengthen the pulse by retriggering, or to shorten by clearing. N74122 has an internal timing resistor which allows the circuit to be operated with only an external capacitor, if so desired. Applications requiring more precise pulse widths and not requiring the clear feature can best be satisfied with N74121.

The output pulse is primarily a function of the external capacitor and resistor. For  $C_{ext} > 1000 pF$ , the output pulse width (t<sub>w</sub>) is defined as:

$$t_{w} = 0.32 R_{T}C_{ext} \left(1 + \frac{0.7}{R_{T}}\right)$$

where

 $R_T$  is in k $\Omega$  (either internal or external timing resistor) Cext is in pF t<sub>w</sub> is in ns

For pulse widths when C<sub>ext</sub> < 1000pF, see Figure B.

These circuits are fully compatible with most TTL or DTL families. Inputs are diode-clamped to minimize reflections due to transmissionline effects, which simplifies design. Typical power dissipation per one shot is 115 milliwatts; typical average propagation delay time to the Q output is 21 nanoseconds. The N74122 and N74123 are characterized for operation from 0°C to 70°C.

# DIGITAL 54/74 TTL SERIES = N74122, S54123, N74123

\* For conditions shown as MIN or MAX, use the value specified under recommended operating conditions for the applicable device type.

- \*\* All typical values are at  $V_{CC} = 5V$ ,  $T_A = 25^{\circ}C$ .
- t Not more than one output should be shorted at a time.

### DESCRIPTION

These monolithic TTL retriggerable monostable multivibrators feature dc triggering from gated low-level-active (A) and high-levelactive (B) inputs, and also provide overriding direct clear inputs. Complementary outputs are provided. A full fan-out to 10 normalized Series 54/74 loads is available from each of the outputs at the low logic level, and in the high-level state, a fan-out of 20 is available. The retrigger capability simplifies the generation of output pulses of extremely long duration. By triggering the input before the output pulse is terminated, the output pulse may be extended. The overriding clear capability permits any output pulse to be terminated at a predetermined time independently of the timing components R and C.

Figure A illustrates triggering the one-shot with the high-level-active (B) inputs.
