DESCRIPTION

These monostables are designed to provide the system designer with complete flexibility in controlling the pulse width, either to lengthen the pulse by retriggering, or to shorten by clearing. N74122 has an internal timing resistor which allows the circuit to be operated with only an external capacitor, if so desired. Applications requiring more precise pulse widths and not requiring the clear feature can best be satisfied with N74121.

The output pulse is primarily a function of the external capacitor and resistor. For $C_{ext} > 1000\text{pF}$, the output pulse width (t_W) is defined as:

$$t_W = 0.32 R_T C_{ext} \left(1 + \frac{0.7}{R_T}\right)$$

where

R_T is in $k\Omega$ (either internal or external timing resistor)

C_{ext} is in pF

t_W is in ns

For pulse widths when $C_{ext} \leq 1000\text{pF}$, see Figure B.

These circuits are fully compatible with most TTL or DTL families. Inputs are diode-clamped to minimize reflections due to transmission-line effects, which simplifies design. Typical power dissipation per one shot is 115 milliwatts; typical average propagation delay time to the Q output is 21 nanoseconds. The N74122 and N74123 are characterized for operation from 0°C to 70°C .

NOTES:

A. H = high level (steady-state), L = low level (steady-state), ↑ = transition from low to high level, ↓ = transition from high to low level, ⌋ = one high-level pulse, ⌋ = one low-level pulse, X = irrelevant (any input, including transitions).

B. NC = No internal connection.

C. To use the internal timing resistor of N74122 ($10k\Omega$ nominal), connect R_{int} to V_{CC} .

D. An external timing capacitor may be connected between C_{ext} and R_{ext}/C_{ext} (positive).

†These conditions are recommended for use at $V_{CC} = 5V$, $T_A = 25^\circ C$.

- NOTES: 1. Voltage values, except intermitter voltage, are with respect to network ground terminal.
2. This is the voltage between two emitters of a multiple-emitter transistor. For the N74122 circuit, this rating applies to each A input with respect to the other and to each B input with respect to the other.
3. Setup time for a dynamic input is the interval immediately preceding the transition which constitutes the dynamic input, during which interval a steady-state logic level must be maintained at the input to ensure recognition of the transition.
4. Hold time for a dynamic input is the interval immediately following the transition which constitutes the dynamic input, during which interval a steady-state logic level must be maintained at the input to ensure continued recognition of the transition.
5. Ground C_{ext} to measure V_{OH} at Q, V_{OL} at $\bar{Q}$, or I_{OS} at Q. C_{ext} is open to measure V_{OH} at Q, V_{OL} at $\bar{Q}$, or I_{OS} at $\bar{Q}$.
6. Quiescent I_{CC} is measured (after clearing) with 2.4V applied to all clear and A inputs, B inputs grounded, all outputs open. $C_{ext} = 0.02\mu F$, and $R_{ext} = 25k\Omega$. R_{int} of S54122/N74122 is open.
7. I_{CC} is measured in the triggered state with 2.4V applied to all clear and B inputs, A inputs grounded, all outputs open. $C_{ext} = 0.02\mu F$, and $R_{ext} = 25k\Omega$. R_{int} of S54122/N74122 is open.

DESCRIPTION

These monolithic TTL retriggerable monostable multivibrators feature dc triggering from gated low-level-active (A) and high-level-active (B) inputs, and also provide overriding direct clear inputs. Complementary outputs are provided. A full fan-out to 10 normalized Series 54/74 loads is available from each of the outputs at the low logic level, and in the high-level state, a fan-out of 20 is available. The retrigger capability simplifies the generation of output pulses of extremely long duration. By triggering the input before the output pulse is terminated, the output pulse may be extended. The overriding clear capability permits any output pulse to be terminated at a predetermined time independently of the timing components R and C.

Figure A illustrates triggering the one-shot with the high-level-active (B) inputs.
