

NCP338

2A Ultra-Small Controlled Load Switch with Auto-discharge Path

The NCP338 is very low Ron MOSFET controlled by external logic pin, allowing optimization of battery life, and portable device autonomy.

Indeed, due to a current consumption optimization with PMOS structure, leakage currents are eliminated by isolating connected IC on the battery when not used.

Output discharge path is also embedded to eliminate residual voltages on the output rail.

Proposed in a wide input voltage range from 1.0 V to 3.6 V, in a small 0.8 x 1.2 mm WLCSP6, pitch 0.4 mm.

Features

- 1.0 V – 3.6 V Operating Range
- 16 mΩ P MOSFET at 3.6 V
- DC Current Up to 2 A
- Output Auto-discharge
- Active High EN Pin
- WLCSP6 0.8 x 1.2 mm
- ESD Ratings: 6 kV HBM, 250 V MM
- This is a Pb-Free Device

Typical Applications

- Mobile Phones
- Tablets
- Digital Cameras
- GPS
- Portable Devices

PIN FUNCTION DESCRIPTION

Pin Name	Pin Number	Type	Description
IN	A2, B2	POWER	Load-switch input voltage; connect a 1 μ F or greater ceramic capacitor from IN to GND as close as possible to the IC.
GND	C1	POWER	Ground connection.
EN	C2	INPUT	Enable input, logic high turns on power switch.
OUT	A1, B1	OUTPUT	Load-switch output; connect a 1 μ F ceramic capacitor from OUT to GND as close as possible to the IC is recommended.

NCP338

FUNCTIONAL DESCRIPTION

Overview

The NCP338 is a high side P channel MOSFET power distribution switch designed to isolate ICs connected on the battery in order to save energy. The part can be turned on, with a wide range of battery from 1.0 V to 3.6 V.

Enable Input

Enable pin is an active high. The path is opened when EN pin is tied low (disable), forcing P-MOS switch off.

The IN/OUT path is activated with a minimum of V_{in} of 1.2 V and EN forced to high level.

Auto Discharge

N-MOSFET is placed between the output pin and GND, in order to discharge the application capacitor connected on OUT pin.

The auto-discharge is activated when EN pin is set to low level (disable state).

The discharge path (Pull down NMOS) stays activated as long as EN pin is set at low level and $V_{IN} > 1.0$ V.

In order to limit the current across the internal discharge N-MOSFET, the typical value is set at 65 Ω .

C_{IN} and C_{OUT} Capacitors

IN and OUT, 1 μ F, at least, capacitors must be placed as close as possible the part to for stability improvement.

APPLICATION INFORMATION

Power Dissipation

Main contributor in term of junction temperature is the power dissipation of the power MOSFET. Assuming this, the power dissipation and the junction temperature in normal mode can be calculated with the following equations:

$$P_D = R_{DS(on)} \times (I_{OUT})^2$$

P_D = Power dissipation (W)
 $R_{DS(on)}$ = Power MOSFET on resistance (Ω)
 I_{OUT} = Output current (A)

$$T_J = P_D \times R_{\theta JA} + T_A$$

T_J = Junction temperature ($^{\circ}$ C)
 $R_{\theta JA}$ = Package thermal resistance ($^{\circ}$ C/W)
 T_A = Ambient temperature ($^{\circ}$ C)

PCB Recommendations

The NCP338 integrates an up to 2 A rated PMOS FET, and the PCB design rules must be respected to properly evacuate the heat out of the silicon. By increasing PCB area, especially around IN and OUT pins, the $R_{\theta JA}$ of the package can be decreased, allowing higher power dissipation.
