SILICON N-CHANNEL MOS FIELD-EFFECT TRANSISTOR

. . . designed for VHF amplifier and oscillator applications in communications equipment.

- High Forward Transadmittance –
  $|y_{fs}|$ = 5000 μmhos (Min) @ f = 1.0 kHz
- Low Input Capacitance –
  C_{iss} = 7.0 pF (Max) @ f = 1.0 MHz
- Low Noise Figure –
  NF = 5.0 dB (Max) @ f = 200 MHz
- High Power Gain –
  P_G = 13.5 dB (Min) @ f = 200 MHz
- Complete "y" Parameter Curves
- Third Order Intermodulation Distortion Performance Curve Provided

HANDLING PRECAUTIONS

MOS field-effect transistors have extremely high input resistance. They can be damaged by the accumulation of excess static charge. Avoid possible damage to the devices while handling, testing, or in actual operation, by following the procedures outlined below:

1. To avoid the build-up of static charge, the leads of the devices should remain shorted together with a metal ring except when being tested or used.
2. Avoid unnecessary handling. Pick up devices by the case instead of the leads.
3. Do not insert or remove devices from circuits with the power on because transient voltages may cause permanent damage to the devices.
