## 6．2A，1200V，NPT Series N－Channel IGBT with Anti－Parallel Hyperfast Diode

The HGTP1N120CND and the HGT1S1N120CNDS are Non－Punch Through（NPT）IGBT designs．They are new members of the MOS gated high voltage switching IGBT family．IGBTs combine the best features of MOSFETs and bipolar transistors．This device has the high input impedance of a MOSFET and the low on－state conduction loss of a bipolar transistor．

The IGBT is development type number TA49317．The diode used in anti－parallel with the IGBT is the RHRD4120 （TA49056）．

The IGBT is ideal for many high voltage switching applications operating at moderate frequencies where low conduction losses are essential，such as：AC and DC motor controls，power supplies and drivers for solenoids，relays and contactors．

Formerly developmental type TA49315．

## Ordering Information

| PART NUMBER | PACKAGE | BRAND |
| :--- | :--- | :--- |
| HGTP1N120CND | TO－220AB | 1N120CND |
| HGT1S1N120CNDS | TO－263AB | 1N120CND |

NOTE：When ordering，use the entire part number．Add the suffix 9A to obtain the TO－263AB in tape and reel，e．g． HGT1S1N120CNDS9A．

## Symbol

## Features

－ $6.2 \mathrm{~A}, 1200 \mathrm{~V}, \mathrm{~T}_{\mathrm{C}}=25^{\circ} \mathrm{C}$
－ 1200 V Switching SOA Capability
－Typical EOFF $200 \mu \mathrm{~J}$ at $\mathrm{T}_{\mathrm{J}}=150^{\circ} \mathrm{C}$
－Short Circuit Rating
－Low Conduction Loss
－Temperature Compensating SABER ${ }^{\text {TM }}$ Model Thermal Impedance SPICE Model www．intersil．com／

NOTE:
3. Turn-Off Energy Loss ( $E_{\mathrm{OFF}}$ ) is defined as the integral of the instantaneous power loss starting at the trailing edge of the input pulse and ending at the point where the collector current equals zero ( $I_{C E}=0 A$ ). All devices were tested per JEDEC Standard No. 24-1 Method for Measurement of Power Device Turn-Off Switching Loss. This test method produces the true total Turn-Off Energy Loss. Turn-on losses include losses due to diode recovery.

## Handling Precautions for IGBTs

Insulated Gate Bipolar Transistors are susceptible to gate-insulation damage by the electrostatic discharge of energy through the devices. When handling these devices, care should be exercised to assure that the static charge built in the handler's body capacitance is not discharged through the device. With proper handling and application procedures, however, IGBTs are currently being extensively used in production by numerous equipment manufacturers in military, industrial and consumer applications, with virtually no damage problems due to electrostatic discharge. IGBTs can be handled safely if the following basic precautions are taken:

1. Prior to assembly into a circuit, all leads should be kept shorted together either by the use of metal shorting springs or by the insertion into conductive material such as "ECCOSORBDTM LD26" or equivalent.
2. When devices are removed by hand from their carriers, the hand being used should be grounded by any suitable means - for example, with a metallic wristband.
3. Tips of soldering irons should be grounded.
4. Devices should never be inserted into or removed from circuits with power on.
5. Gate Voltage Rating - Never exceed the gate-voltage rating of $\mathrm{V}_{\mathrm{GEM}}$. Exceeding the rated $\mathrm{V}_{\mathrm{GE}}$ can result in permanent damage to the oxide layer in the gate region.
6. Gate Termination - The gates of these devices are essentially capacitors. Circuits that leave the gate open-circuited or floating should be avoided. These conditions can result in turn-on of the device due to voltage buildup on the input capacitor due to leakage currents or pickup.
7. Gate Protection - These devices do not have an internal monolithic Zener diode from gate to emitter. If gate protection is required an external Zener is recommended.

## Operating Frequency Information

Operating frequency information for a typical device (Figure 3) is presented as a guide for estimating device performance for a specific application. Other typical frequency vs collector current (ICE) plots are possible using the information shown for a typical unit in Figures 6, 7, 8, 9 and 11. The operating frequency plot (Figure 3) of a typical device shows $f_{M A X 1}$ or $f_{M A X 2}$; whichever is smaller at each point. The information is based on measurements of a typical device and is bounded by the maximum rated junction temperature.
$\mathrm{f}_{\mathrm{MAX} 1}$ is defined by $\mathrm{f}_{\mathrm{MAX} 1}=0.05 /\left(\mathrm{t}_{\mathrm{d}(\mathrm{OFF}){ }^{+}} \mathrm{t}_{\mathrm{d}(\mathrm{ON}) \mathrm{I}}\right)$. Deadtime (the denominator) has been arbitrarily held to 10\% of the on-state time for a $50 \%$ duty factor. Other definitions are possible. $\mathrm{t}_{\mathrm{d}(\mathrm{OFF}) \mid}$ and $\mathrm{t}_{\mathrm{d}(\mathrm{ON}) \mid}$ are defined in Figure 21. Device turn-off delay can establish an additional frequency limiting condition for an application other than $\mathrm{T}_{\mathrm{JM}} \cdot \mathrm{t}_{\mathrm{d}(\mathrm{OFF})}$ I is important when controlling output ripple under a lightly loaded condition.
$f_{\text {MAX2 }}$ is defined by $f_{\text {MAX2 }}=\left(P_{D}-P_{C}\right) /\left(E_{\text {OFF }}+E_{\text {ON }}\right)$. The allowable dissipation $\left(P_{D}\right)$ is defined by $P_{D}=\left(T_{J M}-T_{C}\right) / R_{\theta J C}$. The sum of device switching and conduction losses must not exceed $P_{D}$. A $50 \%$ duty factor was used (Figure 3) and the conduction losses $\left(\mathrm{P}_{\mathrm{C}}\right)$ are approximated by
$P_{C}=\left(V_{C E} \times I_{C E}\right) / 2$.
$\mathrm{E}_{\mathrm{ON}}$ and $\mathrm{E}_{\text {OFF }}$ are defined in the switching waveforms shown in Figure 21. $\mathrm{E}_{\mathrm{ON}}$ is the integral of the instantaneous power loss ( $\mathrm{I}_{\mathrm{CE}} \times \mathrm{V}_{\mathrm{CE}}$ ) during turn-on and $\mathrm{E}_{\mathrm{OFF}}$ is the integral of the instantaneous power loss ( $\mathrm{I}_{\mathrm{CE}} \times \mathrm{V}_{\mathrm{CE}}$ ) during turn-off. All tail losses are included in the calculation for $\mathrm{E}_{\mathrm{OFF}}$; i.e., the collector current equals zero ( $\mathrm{I}_{\mathrm{CE}}=0$ ).
